

Due to the nature of vascular disease and the potential for the condition to become more complicated, we encourage anyone struggling with this condition to go through with the recommended treatment to avoid developing any serious issues. Although it's important to understand the risks of COVID-19 exposure, we ensure you that you're in good, safe, (and clean) hands when you visit SAVI.

Our doctors, specialists, and front desk administrators are consistently sanitizing, cleaning, and disinfecting all medical equipment and highly trafficked areas thoroughly, before, during, and after each patient visit.

Our Precautionary Measures:

- Implementing social distancing policies and conducting daily temperature checks for staff, patients, and visitors.
- Requiring all staff, patients, and visitors to wear a mask while at SAVI.
- Ensuring medical equipment is cleaned and disinfected thoroughly before, during, and after each patient visit.
- Pre-screening our patients prior to their appointments.
- Conducting on-site temperature checks and as well as symptom checks to verify the health of each patient before treatment.
- Increasing sanitation of high-traffic areas.
- Following all guidance from CDC.

Why You Shouldn't Delay PAD Treatment:

- PAD raises risk for heart attack and stroke
- Treatment can be done quickly and recovery is short
- Painful PAD symptoms can affect your mobility
- Small cuts or wounds will take longer to heal, or may not heal at all
